FOR THE RISK MANAGER · A PREVIEW BEFORE IT IS BUILT

EON RISK SERVICES

RiskID Workbench

The AI risk identification method as software. Your register, your evidence, your machine.

Open source · runs on your laptop · nothing leaves the building

Built on *AI Risk Identification: The Complete Methodology*

WHY

The register is right on the day it is signed. Then it drifts.

Every AI framework begins with "identify the risks" and none of them says how. The book says how, in six phases and nine templates. Readers then do the work in spreadsheets, and spreadsheets forget: a score typed without its basis, a residual lowered without a test, a line deleted instead of retired, a record that cannot be rebuilt when the supervisor asks for 30 June.

What the Workbench does

It is the method, as a program. Every form is one of the book's templates. Every rule in chapters 9 and 11 is enforced by the software, not remembered by you. One record produces every document the method calls for, and an audit trail replays the register as it stood on any date.

> **Four promises.** The software never owns or scores a risk; a named person does. Nothing is deleted. A residual score cannot fall below the inherent score until a tested control says so. Your data stays on your machine.

What it is not

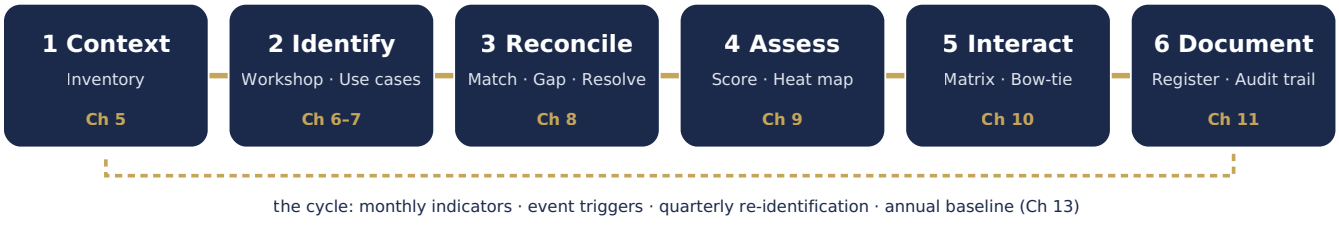

Not a cloud service, not a scoring engine, not a chatbot. An AI assistant is available if you switch it on, and it drafts; it never decides. The continuous watching of regulators and vendors is a separate, retained service (the Harness) that posts triggers into this tool when you subscribe to it.

91 register lines preloaded, scored, with owners and indicators

9 templates from Appendix B, as forms

1 file: your organisation, portable, yours

The six phases, one screen each

PHASE 1 AND 2 · **CHAPTERS 5, 6, 7**

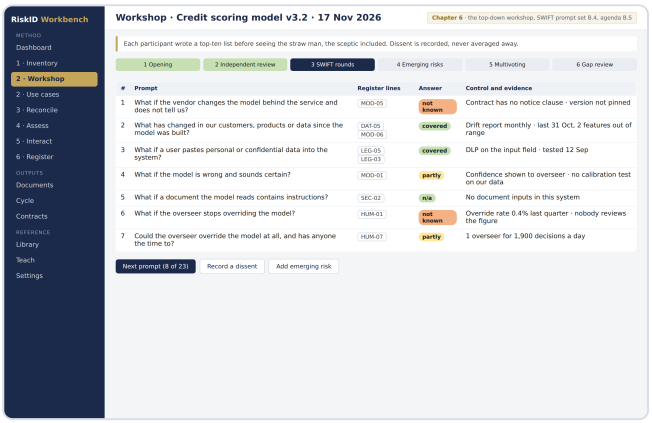

Know what you have. Then ask the twenty-three questions.

Inventory. One line per AI system, the eighteen fields of template B.1: who built it, which model and version, the purpose as stated and as used, who it affects, the role under the Act, the Article 6 outcome, the owner by name, the lifecycle stage, where the logs are. The form will not save without an owner, a role and a classification.

Start from the library. The 91 lines of the book's register are already in the tool. Pick a system and it proposes the lines that match its stage, role and data, each with the reason. Adopt them; they keep their IDs, so your register can be compared with anyone else's that uses the book.

The workshop. Chapter 6's four-hour session, run from one screen: the pre-workshop lists stay hidden until stage 2; the 23 SWIFT prompts walk past each system; multivotes are recorded per person, and a dissent is kept, never averaged away.

> **Simple instructions.** 1 Add a system. 2 Click "propose lines". 3 Book the workshop and hand the facilitator this screen.

The facilitator's view at stage 3: each prompt, the register lines it maps to, the answer and its evidence.

Use cases, bottom-up. The operator of a system completes template B.2 for a risk. The three fields the book says fail most are checked on save: a driver that only says "model error" comes back; a control called "human in the loop" with no override figure comes back; a data quality of Medium needs its basis. The book's MOD-05 example sits in every box as a placeholder.

PHASE 3 AND 4 · **CHAPTERS 8, 9**

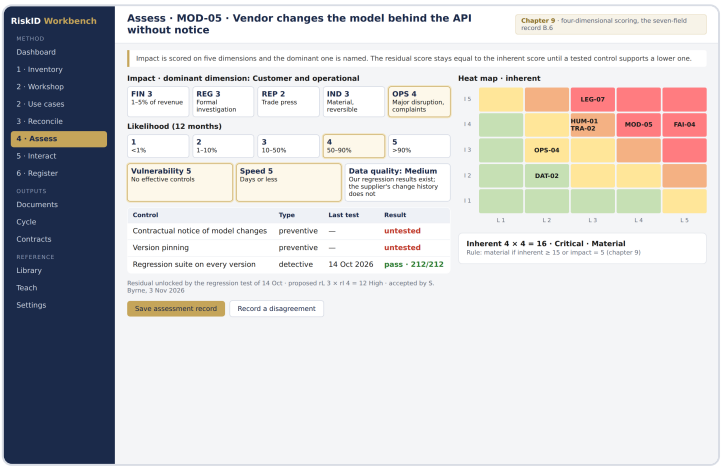

Score with the book's scales, and watch the heat map move.

Reconcile first. The five steps of chapter 8 on one screen: match top-down to bottom-up, show the gaps both ways, challenge, resolve with a reason, record. The disagreement log is written here, minority score and all.

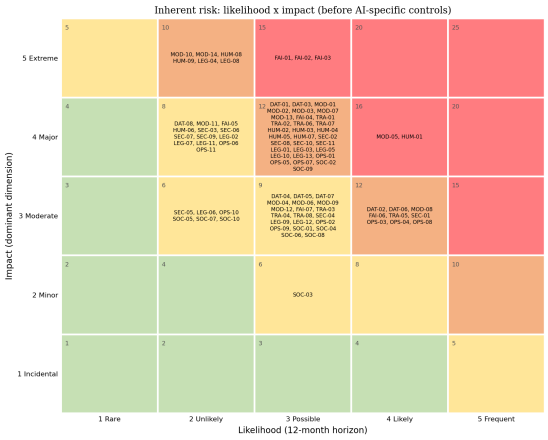

Then assess. Impact is scored on each of the five dimensions and the dominant one is named; when harm to individuals is high but not dominant, the tool asks for the reasoning. Inherent is likelihood times impact, banded as the book bands it; material if 15 or more, or impact 5, with the rules above the score applied for you.

The lock that spreadsheets lack. The residual score stays equal to the inherent score until at least one control on the line has a test date and a result. Lowering it records who, when, and on what evidence.

> **Simple instructions.** 1 Pick the five impact levels; read the description beside each. 2 Pick likelihood, vulnerability, speed. 3 Enter the controls and their tests; the residual unlocks itself.

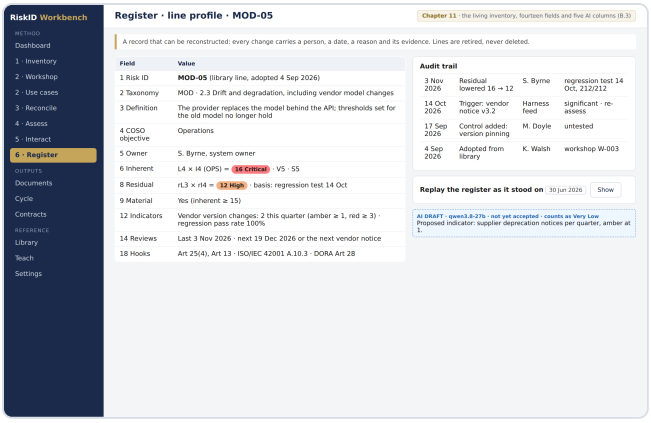

Assessing MOD-05: five impact dimensions with their descriptions, likelihood on the twelve-month horizon, vulnerability, speed of onset, data quality with its basis, and the controls with their last test.

The book's own inherent heat map for the 91-line reference register; yours is drawn the same way.

PHASE 5 AND 6 · **CHAPTERS 10, 11**

The record that can be reconstructed.

A line profile: the fourteen fields and five AI columns of template B.3, the audit trail, replay to a date, and an AI draft waiting for a person.

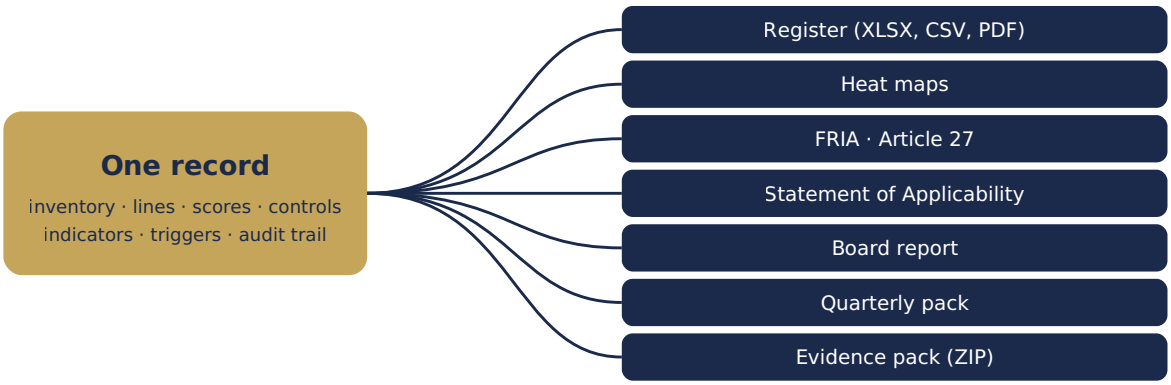

Interaction. Chapter 10's matrix of which lines trigger or amplify which, a bow-tie editor for every material line, and a concentration view that shows how many systems depend on one vendor or one model.

The living inventory. Template B.3 as a grid: Risk ID, taxonomy, definition, COSO objective, owner, inherent, controls, residual, material, data quality, interactions, indicators, trend, review dates, and the five AI columns: lifecycle stage, role, persons affected, regulatory hooks, Annex A controls.

Retire, never delete. A retired line keeps its ID and its history. Every change is an event with a person, a date, a reason and its evidence.

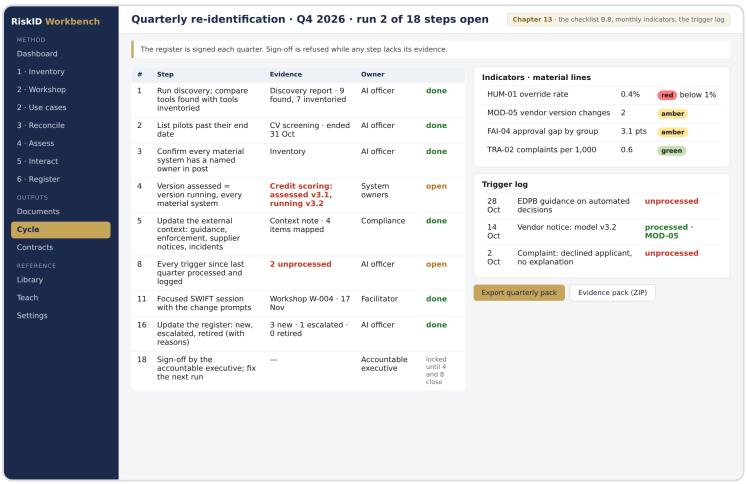

> **The auditor's question.** "Show me the register as it stood on 30 June, and why MOD-05 was re-scored in August." Pick the date; the tool replays it. Open the line; the change, the person, the reason and the test are there.

One record, every document

The FRIA is assembled per system from the mapping in B.7, each Article 27(1) element drawn from the fields that answer it. The Statement of Applicability lists the Annex A controls your live lines rely on. The board report is the Principal AI Risk Report of chapter 12: top risks, movements, breaches, triggers, decisions. Every document records the data-pack versions and the state it was built from.

Monthly, on an event, quarterly, annually. Signed.

Quarter-end: the eighteen steps of checklist B.8 with evidence and owner, the indicators in green, amber and red, the trigger log, and a sign-off that refuses while a step is open.

Monthly. The indicator sheet for each material line, with the chapter 13 indicators as presets: override rate, drift, vendor version changes, complaints per thousand, cost per transaction.

On an event. Log a trigger, or let the Harness service post it. The tool names the lines it touches and opens an update with a significance decision.

Quarterly and annually. The checklist, the focused workshop with the change prompts, the re-assessment of material lines, the signed register, the pack.

> **Simple instructions.** 1 On the first of the month, open Cycle and read the indicators. 2 When anything arrives from a regulator or a vendor, log it as a trigger. 3 At quarter-end, run the checklist top to bottom and have the accountable executive sign.

BUILT ON THE BOOK

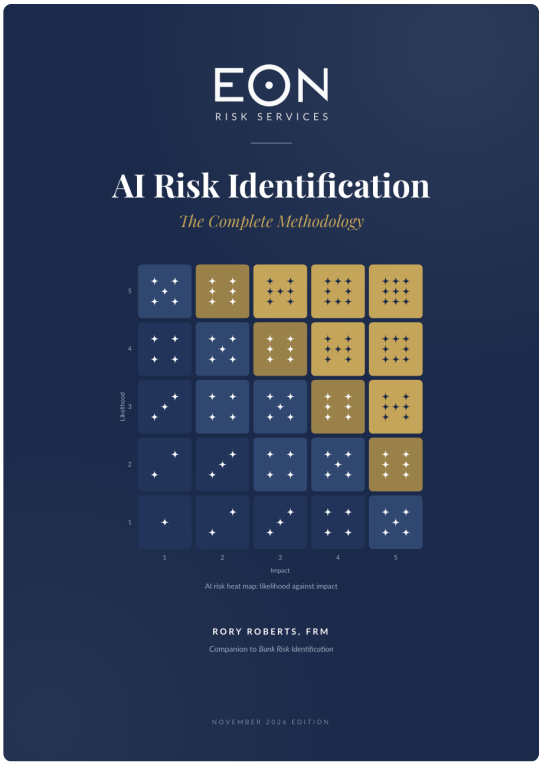

What each part does, and where it comes from.

Part of the tool	What it does for you	From the book
Inventory	Lists every AI system once, with the eighteen facts later phases rely on	Ch 5 · template B.1
Library	The 91-line register and the taxonomy, preloaded; proposes lines per system	Ch 4 · Appendix A
Workshop	Runs the top-down session: blind pre-lists, 23 SWIFT prompts, multivoting, dissent kept	Ch 6 · B.4, B.5
Use cases	The bottom-up template with the three failing fields checked on save	Ch 7 · B.2
Reconcile	Match, gap, challenge, resolve, record; the disagreement log	Ch 8
Assess	Five impact scales, dominant dimension, likelihood, vulnerability, speed, data quality; the residual lock; the heat map	Ch 9 · B.6
Interact	Interaction matrix, bow-ties, vendor and model concentration	Ch 10
Register	The living inventory, line profiles, audit trail, replay to any date	Ch 11 · B.3
Documents	Register, heat maps, FRIA, Statement of Applicability, board report, packs	Ch 12 · B.7
Cycle	Indicators, trigger log, quarterly checklist, annual baseline, sign-off	Ch 13 · B.8
Contracts	Seventeen clauses per vendor system, gaps shown against lines	B.9
Hooks and calendar	Articles and clauses per line; the role-and-date calendar as an updatable pack	Ch 15
Teach	Every screen names its chapter and shows its opening case	Ch 1–16
Assistant (optional)	Drafts templates, SWIFT answers and report narrative; marked as drafts until a person accepts	Ch 14

GETTING STARTED

Three steps, then the book takes over.

1. **Install.** One command (`pipx install riskid-workbench`) or download the single file for your computer. Nothing to configure.
2. **Open.** `riskid serve` opens the Workbench in your browser, on your machine only. Create your organisation file; the library is already inside.
3. **Begin at chapter 5.** Add your first system. The tool proposes its lines. Book the workshop. The rest follows the book, screen by screen.

The method the tool implements. The book is free; the tool will be.

Open source. Apache-2.0. Read the code, run it anywhere, keep it forever. The method belongs to the practitioners who use it.

Your data. One file on your disk. No account, no cloud, no telemetry. The assistant, if you switch it on, sees only the screen you are on, and you choose the model, including one running in your own building.

EON RISK SERVICES

The method, kept honest by the software.

A preview. The specification and the build plan sit beside this brochure; the first release follows them round by round.

For whom. The risk or compliance lead, the DPO, the AI officer, the consultant: the person who has to produce the evidence that ISO/IEC 42001 clause 6.1.2 and Article 9 of the AI Act ask for.

With what. The book, which is free, and this tool, which will be.

Kept current. The retained Harness service watches regulators, standards and vendors and posts what changes into your trigger log, with its source, for a named owner to accept or reject.
